

ABSTRACT

An image transmission system enabling a user to recognize a communication status between a PC and a projector, and including a
5 PC (300) as an image generating apparatus and a projector (400) as
an image projecting apparatus. The projector (400) monitors a
status of communication with the PC (300), and includes a status
monitoring unit (402) generating information related to the
communication status being monitored, and also a projector
10 communication unit transmitting the generated information related
to the communication status to the PC (300). The PC (300)
includes a PC communication unit (301) receiving information
related to the communication status from the projector (400), a
beacon analyzing unit (302) analyzing the received information and
15 a display output unit (303) displaying a result of the analysis by the
beacon analyzing unit (302).
